# Modeling Modifications to Einstein's theory

## Case Study: Massive Gravity

Special Relativity tells us that for a propagating massive particle

$$\frac{v_g^2}{c^2} = 1 - \frac{m_g^2 c^4}{h^2 f^2} = 1 - \frac{c^2}{\lambda_g^2 f^2}$$

**GWs emitted close to merger travel faster than those emitted in the early inspiral.**

GW Phase is sensitive to the GW frequency x GW travel time

$$\Psi_{\text{GW}} = f T_g = f \frac{D}{v_g} \sim \frac{f D}{c} + \frac{c D}{2 \lambda_g^2 f}$$

**Massive graviton effect accumulates with distance travelled.**
