Survey and Time-domain  
Astrophysical Research eXplorer

## STAR-X

A composite image showing a satellite in space, a bright orange star, a blue nebula, and a galaxy, representing the mission's focus on high-energy astrophysics.

**The big news, August 18, 2022:**  
STAR-X was selected as one of 2 finalists for a competitive Phase A MIDEX mission study. This process to be completed in late 2023

EXPLORING THE FAST, FURIOUS, AND FORMING UNIVERSE

William W. Zhang, Principal Investigator  
Ann Hornschemeier, Deputy Principal Investigator

In response to NASA's Astrophysics Explorers Program 2021 Medium Explorer (MIDEX) Announcement of Opportunity – NNH21ZDA0180 • December 9, 2021

Logos for the participating institutions: NASA Goddard Space Flight Center, Bluewin, MIT (Massachusetts Institute of Technology), and LASP (Laboratory for Atmospheric and Space Physics).

# STAR-X: Ready for launch in 2028

X-ray Telescope (XRT)

Ultraviolet Telescope (UVT)

# Exploring the Fast, Furious, and Forming Universe

## *The STAR-X Science Story*

**The FAST:** Locally rare, brief events have an outsized impact on the Universe.

*Supernova  
Explosion*

The heavy elements needed for life are synthesized in and dispersed by supernovae and neutron star mergers. Similarly, a single stellar superflare can evaporate an ocean or catalyze prebiotic pathways. The STAR-X wide field UV/X-ray design and fast and flexible operations captures these events.

**The FURIOUS:** Black holes grow extremely rapidly at early times in the Universe and are critical to galaxy evolution.

*Tidal Disruption  
Event (TDE)*

STAR-X will uniquely probe the physics of rapid accretion that allowed massive black holes to grow so quickly in the early Universe. STAR-X will catch transient, extreme black hole feeding events, such as TDEs, where entire stars are disrupted.

**The FORMING:** Distant galaxy clusters provide maximal leverage in evolutionary studies of structure formation and chemical enrichment.

*Clusters of  
Galaxies*

STAR-X will conduct deep surveys and discover the elusive diffuse emission from the largest bound objects in the Universe (clusters of galaxies), shortly after their birth. STAR-X's combination of excellent imaging and low particle background (due to orbit choice) makes this possible in a way that no other mission can.

## What is STAR-X?

- Three largely independent subsystems: XRT, UVT, and SC
- Each independently built and qualified
  - XRT by GSFC+MIT
  - UVT by Univ. of Colorado
  - SC by Ball Aerospace
- Easy integration and testing: “plug and play”
  - Obs. Integration and testing by Ball Aerospace

# Key Features of the X-ray Telescope

- Excellent PSF: 2.5" on-axis, 8" 0.5-deg off-axis.
- Large FOV: 1 deg<sup>2</sup>.
- Large effective area: >1,800 cm<sup>2</sup> at 1 keV.
- Low particle background.

# Key Features of the UV Telescope

- Excellent PSF:  
4" on- and off-axis.
- Large FOV: 1.0  $\text{deg}^2$ .
- Good effective area:  
25 – 55  $\text{cm}^2$ .
- Five filters
  - 180 nm
  - 220 nm
  - 225 nm
  - 275 nm
  - 325 nm

# STAR-X Science: Eight science objectives

Survey and Time-domain Astrophysical Research eXplorer

First Light from Supernovae

**FAST**

XRT+UVT

Neutron Star Mergers

XRT+UVT

Stellar Flares and Exoplanets

XRT+UVT

Tidal Disruption Events

**FURIOUS**

XRT+UVT

Extreme Accretion

XRT+UVT

Protoclusters

XRT

High-z Galaxy Clusters

**FORMING**

XRT

Cluster Outskirts

XRT

#### 1-1 Supernovae

XRT discovers a shock breakout and triggers a ToO to catch cooling in the UV

#### 2-1 Tidal Disruption

Weekly X-ray/UV monitoring rapidly reveals hundreds of new TDEs

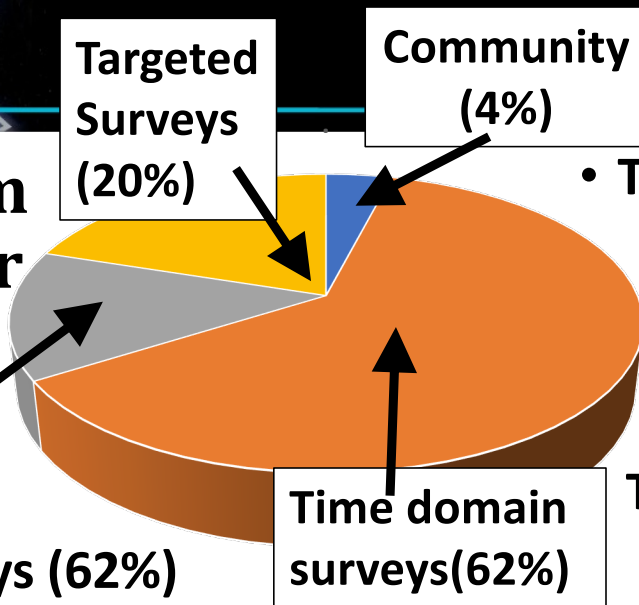

#### 2-2 AGN Accretion Flows

Daily X-ray/UV monitoring probes accretion disk structure via time lags

STAR-X finds rare and brief events and rare and faint high-z objects  
 Final depths: MEDIUM:  $3 \times 10^{-16}$  cgs over 300 deg<sup>2</sup> (~100 Chandra COSMOS fields),  
 DEEP:  $7 \times 10^{-17}$  cgs over 12 deg<sup>2</sup>

# Science Program for the Two Year Prime Mission

## • Time Domain Surveys (62%)

- Deep survey: Rubin deep drilling fields
  - 12 deg<sup>2</sup>, **Daily Cadence**, 1500 s
  - Optimized for rapid transients and AGN variability
  - 1x10<sup>-14</sup>cgs (X-ray) and 22.2 mag (UV, F180M) and 23.3 mag (UV, F275M)
- Medium survey: Stripe 82 + Subaru fields, & Rubin deep drilling fields
  - 300 deg<sup>2</sup>, **Weekly Cadence**, 500 s
  - Optimized for TDEs
  - 3x10<sup>-14</sup>cgs (X-ray) and 21.9 mag (UV, F180M)

## • Targets of Opportunity (14%)

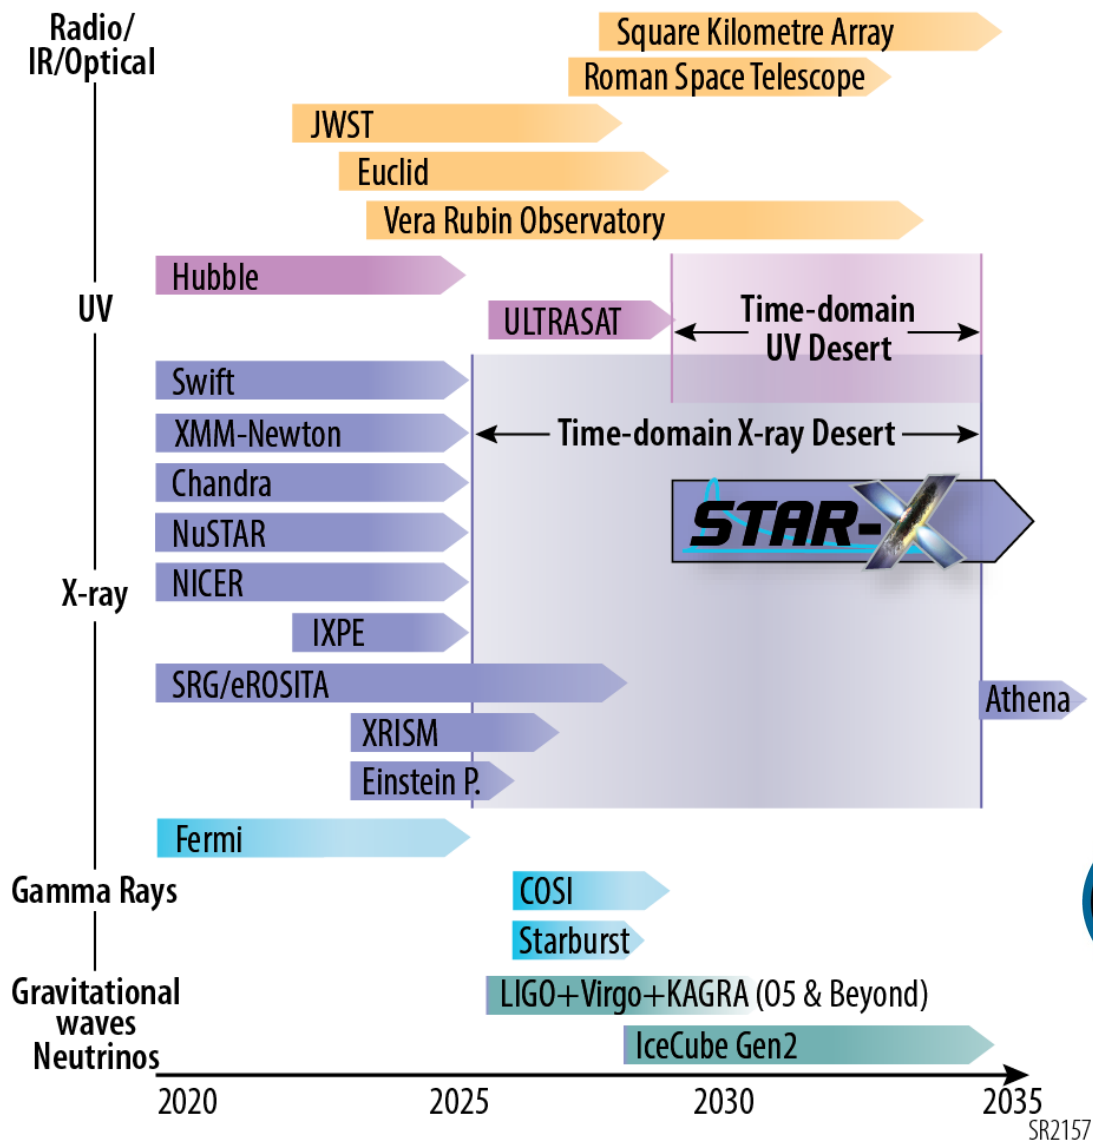

- Young supernovae
- GW X-ray/UV counterparts
- GW source late-time follow-up
- Tidal-disruption events

## Targeted Surveys (20%)

- 10 nearby galaxies
- 9 low-mass, planet-bearing stars
- 20 high-z SZ-detected clusters
- 20 nearby clusters

## • Community Program (4%, 1.8 Ms)

- Impromptu requests from the broad community

# Why STAR-X and Why Now?

STAR-X fills the gap in X-ray and UV time-domain coverage in the late 2020s, providing simultaneous X-ray and UV observations that complement optical, infrared, and gravitational wave facilities.
